**Your ERP is the nervous system of your organization, and you rely on vendors, development staff, team leads, and third parties to keep it running smoothly and efficiently, all the time.**

CodeExcellence's industry-leading suite of products helps optimize your SAP installation by introducing controls and governance in your development process. Whether the team is distributed or agile, CodeExcellence will help introduce consistency and accountability to minimize risk and eliminate hazards in production.

### Monitor the Development

Whether your team is next door or on the other side of the world, Hawkeye Monitor will continuously monitor all development, all the time, to highlight hazards that will harm the business.

### Empower the Developers

Hawkeye APOD helps Developers effortlessly conform to corporate requirements, with easy access to documentation about each rule. The result? The entire team will apply best practices consistently to every line of ABAP code.

### Control the Process

Hawkeye Transport Control (TC) helps Tech Leads identify dependencies, errors, or quality issues before releasing transports. With Hawkeye TC, each project team can set up automatic quality gates and understand exactly what needs to be done for smooth releases to QA and Prod.

### Tighten Up Unit Tests

Using built-in SAP functions, Hawkeye Unit Test Monitor (UTM) provides Developers and Tech Leads with ABAP code coverage statistics. UTM highlights exactly what was tested and what remains to be tested to ensure all branches, procedures and methods are covered.

### Eliminate Landscape Inconsistencies

The last thing you want is to find out that some services are unavailable during QA after transports are already released. Hawkeye Landscape Consistency (LC) exposes any inconsistencies between different systems in a landscape to eliminate these unpleasant surprises.

### Stabilize Production

Co-developed with one of Canada's largest telecoms, this new add-on to the Hawkeye product line continuously monitors production statistics to help identify disruptive custom code and develop an intelligent strategy to remediate legacy code violations.
